## Voltage Mode PWM Controller

SOP-16

DIP-16

**Supply Voltage Range 7 V to 40V**  
**Output Driving Current 200mA**  
**Oscillator Frequency up to 200KHz**

### General Description

The TS494 incorporates on a single monolithic chip all the functions required in the construction of a pulse-width-modulation control circuit. Designed primarily for power supply control, these devices offer the systems engineer the flexibility to tailor the power supply control circuitry to his application.

The TS494 contains an error amplifier, an on-chip adjustable oscillator, a dead-time control comparator, pulse-steering control flip-flop, a 5-volt, 5% precision regulator, and output-control circuits. The error amplifier exhibits a common-mode voltage from  $-0.3V$  to  $V_{CC} - 2V$ . The dead-time control comparator has a fixed offset that provides approximately 5% dead time when externally altered. The on-chip oscillatory be bypassed by terminating  $R_T$  (pin 6) to the reference output and providing a sawtooth input to  $C_T$  (pin 5), or it may be used to drive the common circuits in synchronous multiple-rail power supplies. The uncommitted output transistor provide either common-emitter or emitter-follower output capability. Each device provides for push-pull or single-ended output operation, which may be selected through the output-control function. The architecture of these devices prohibits the possibility of either output being pulsed twice during push-pull operation.

The TS494 is offered in SOP-16 and DIP-16 package.

### Features

- ◇ Complete PWM Power Control Circuitry
- ◇ Uncommitted Outputs for 200mA Sink or Source Current
- ◇ Output Control Selects Single-Ended or Push –Pull Operation
- ◇ Internal Circuitry Prohibits Double Pulse at Either Output
- ◇ Variable Dead-Time Provides Control over Total Range
- ◇ Internal Regulator Provides a Stable 5-V Reference Supply with 5% Tolerance
- ◇ Circuit Architecture Allows Easy Synchronization

### Pin Assignment

### Applications

- ◇ Charger
- ◇ DC to DC converters

#### Remark:

- All typical value except for temperature coefficient are at Ta= 25 °C
- For conditions shown as Min or Max, use the appropriate value specified under recommended operating conditions.
- All typical values except for parameter changes with temperature are at Ta= 25 °C
- Duration of the short-circuit should not exceed one second
- Standard deviation is a measure of the statistical distribution about the mean as derived from the formula

$$\sigma = \left[ \sum_{n=1}^N \frac{(x_n - \bar{x})^2}{N - 1} \right]^{1/2}$$

- Temperature coefficient of timing capacitor and timing resistor not taken into account
